11. (Original) A method to analyze network performance, comprising generating a flows report to monitor a given flow, the given flow having one or more frames that are sent from a sending node to a receiving node, and the flows report having one or more attributes including:
- an errors attribute depicting the number of errors belonging to the one or more frames;
 - a sending node attribute indicating the sending node;
 - a receiving node attribute indicating the receiving node;
 - a data duration attribute indicating a time period from when the sending node sent a first frame in the flow to the time that the receiving node received the last frame having data in the flow;
 - an average data rate attribute indicating an average data rate for the flow;
 - a bytes attribute indicating a total number of bytes in the frames in the flow;
 - a data payload bytes attribute indicating a sum of the payload bytes for the frames in the flow;
 - a frames attribute indicating a number of frames in the flow;
 - a data frames attribute indicating a number of frames having data in the flow;
 - a first frame attribute indicating a sequence number of the first frame in the flow;
 - a last data frame attribute indicating a sequence number of the last frame having data in the flow;
 - a last frame attribute indicating the sequence number of the last frame, having one of data and acknowledgement;
 - a start time attribute indicating a time that the first frame having data was sent;

an end data time attribute indicating a time that the last frame having data was received;

an end time attribute indicating a time that the last frame, having one of data and acknowledgement, was received;

a data direction attribute indicating a direction in which the flow was traveling; and

a network busy time attribute indicating a total time that the one or more frames was in transit during the flow.

12. (New) A method of analyzing network performance when executing a task, comprising displaying a chart, the chart further comprising:
 - a first and a second time during which one or more meaningful frames within the network are traveling in a first and a second direction, respectively, the first and second times each represented by a bar that shows at least one of:
 - an insertion time representing a cumulative time for one or more meaningful frames to be inserted into the network, and
 - a QPP time during which the one or more meaningful frames were within the network as a result of queuing, processing, and propagation; and
 - a time set representing one or more times during which each of one or more nodes in the network is respectively active during the task, whereby each of the one or more nodes is represented by a bar that shows at least one of:
 - a total amount of time that the node was processing, and
 - a total amount of time that the node was sending but not processing.

13. (New) The method of claim 12, wherein the insertion time for each meaningful frame is computed as $\text{AdjustedBytes} * 8 / \text{Bandwidth}$, where AdjustedBytes represents a number of bytes that would have traversed a Wide Area Network (WAN) link in the network.
14. (New) The method of claim 12, further comprising the step of displaying the first and second times and the time set in a detailed report.
15. (New) The method of claim 14, wherein the detailed report further comprises one or more of:
- an overall summary comprising a duration of the task;
 - a traffic section comprising byte and frame information;
 - a network busy time section comprising insertion time, QPP time and total time;
 - a network frame transit statistics section comprising transit times for the frames within the network during the task;
 - a node active time section comprising processing and sending times for each node in the network; and
 - a node processing statistics section comprising statistics on processing periods of the nodes in the network.
16. (New) A method of analyzing network performance when executing a task, comprising displaying within a detailed report:
- a first and a second time during which one or more meaningful frames within the network are traveling in a first and second direction, respectively;
 - a time set representing one or more times during which each of one or more nodes in the network is respectively active during the task;

- an overall summary comprising a duration of the task;
- a traffic section comprising byte and frame information;
- a network busy time section comprising insertion time;
- a network frame transit statistics section comprising transit times for each frame;
- a node active time section comprising processing, sending and total active times for each node in the network; and
- a node processing statistics section comprising statistics on node processing periods.

17. (New) The method of claim 16, wherein an insertion time for each meaningful frame is displayed, the insertion time computed as $\text{AdjustedBytes} * 8 / \text{Bandwidth}$, where AdjustedBytes represents the number of bytes that would have traversed a Wide Area Network (WAN) link in the network.
18. (New) A method of monitoring network performance when executing a task, comprising displaying a first processing time corresponding to a first node in the network, the processing time having one or more attributes including a processing type, the processing type comprising one of:
 - a time period prior to a first data frame within a thread sent by a client;
 - a time period prior to a subsequent request within a thread is sent by the client;
 - a time period from a last data frame to an end of the task;
 - a time period prior to a first data frame in a thread sent by a server;
 - a time period from a point that a last frame within a thread in a request is received by the server to a time that a first response frame is returned by the server;
 - a time period that a first server processes after receiving a request from a lower tier until the first server begins sending a subsequent request to a second server;

a time period that the first server processes after receiving a reply from the second server until the second server begins sending its reply to a third server, the third server being a requesting node.

19. (New) The method of claim 18, further comprising displaying one or more additional processing times, each additional processing time corresponding to an additional node in the network.
20. (New) The method of claim 19, wherein each processing time additionally includes at least one of the following attributes:
 - a number of errors associated with one of a start frame and an end frame;
 - a duration of the processing time;
 - a time at which a node corresponding to the processing time began processing;
 - a time at which a node corresponding to the processing time stopped processing;
 - a start frame representing a frame number corresponding to commencement of the processing time;
 - a description of the start frame;
 - an end frame representing a frame number corresponding to termination of the processing time; and
 - a description of the end frame.

21. (New) A method of monitoring network performance when executing a task, comprising:
- displaying a first processing time corresponding to a first node in the network, the first processing time having one or more attributes including a processing type; and
- displaying at least one additional processing time, each additional processing time corresponding to at least one node in the network other than the first node, wherein each processing time includes at least one of the following attributes:
- a number of errors associated with one of a start frame and an end frame,
 - a duration of that processing time,
 - a time at which a node corresponding to that processing time began processing,
 - a time at which the node corresponding to that processing time stopped processing,,
 - a start frame representing a frame number corresponding to commencement of that processing time,
 - a description of the start frame,
 - an end frame representing a frame number corresponding to termination of that processing time, and
 - a description of the end frame.
